The genes were isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      printed

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention provides nucleic acids encoding Arabidopsis plastidic cacetyl CoA synthetase (ACS), various subunits (specifically the E3 csubunit) of plant plastidic pyruvate dehydrogenase (pPDH), the A and B subunits of a plant ATP citrate lyase (ACL), Arabidopsis pyruvate decarboxylase (PDC), Arabidopsis aldehyde dehydrogenase (ALDH), specifically ALDH-2 and ALDH-4. The polypeptides can be expressed by standard recombinant methodology. The ACS, pPDH, ACL, PDC and ALDH CC used to alter the level of acetyl CoA in a plant or plant cell, tissues or organs. A decrease in acetyl CoA is expected to affect the blosynthesis of very long chain fatty acids and flavonoids. The enzymes may also be used for in vitro synthesis of acetyl CoA, which in turn can be used to produce acetyl COA phytochemicals (plastidic ACS, pPDH, ACL, pyruvate decarboxylase, acetyl COA phytochemicals (plastidic ACS, pPDH, ACL, of acetyl COA is expected to affect the biosynthesis of acetyl COA phytochemicals (plastidic ACS, pPDH, ACL, of acetyl COA phytochemicals (plastidic ACS, pPDH, ACL, of acetyl COA phytochemicals (plastidic ACS, pPDH, ACL, of acetyl COA, which in turn can be used to produce acetyl COA phytochemicals (plastidic ACS, pPDH, ACL, of acetyl COA, acetyl COA phytochemicals (plastidic ACS, pPDH, ACL, of acetyl COA, acetyl COA, which in the biosynthesis of acetyl COA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A cosmid bank of T. niveum ATCC 34921 genomic DNA was screened with a fragment of the glyceraldehyde-3-phosphate-dehydrogenase (GAPDH) gene from Penicillium chrysogenum. A 2.2 kb fragment was identified (AAQ7827) and cloned in pUC18 to give pGT1. A 665 bp HindIII-HindIII fragment of this was used to screen cosmid DNA to identify a DNA fragment (AAQ78279) containing the GAPDH promoter. A sequence (AAQ787878) encoding the GAPDH gene (gpdA) was isolated from a cDNA library. The full sequence of the genomic gpdA structural gene is given in AAQ78280 and the corresponding protein sequence in AAR65965. The GAPDH promoter is useful for expression foreign accordance in SAR65965.
                This invention describes novel human nucleic acid (cDNA) sequences (A), that are highly expressed in uterine tumour tissue and which have anticancer and cytostatic activity. (A) are used (1) for recombinant expression of polypeptides (B) and (ii) to isolate complete genes. (B) are used (i) to identify agents suitable for treatment of uterine or endometrial cancer; (ii) directly for treating these forms of cancer (including expression from gene therapy vectors) and (iii) for generation of specific antibodies. (A) are identified by assembling ESTs
                                                                                                                                                                                                                                   New nucleic acid sequences expressed in uterine cancer tissues, derived polypeptides, for treatment of uterine and endometrial cand identification of therapeutic agents
                                                                                                                                                                                                    Claim

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 of expression patterns. This allows a significantly longer fragment of the gene to be revealed, so should reduce the number of failures associated with the fact that ESTs from different libraries may represe different parts of the same unknown gene, distorting the estimated frequency of occurrence in a particular tissue. AAY59941-Y60328 represe protein fragments encoded by the human endometrium tumour cDNA library
                                                                                                                                 analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a protein described in the particularly constitution of the control of the co
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel polynucleotides derived from Coryneform bacteria, for identifying mutation point of a gene, measuring expression of a gene, analysing expression profile or pattern of a gene and identifying homologous gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                organic

                                                                                                                                                              AAY34584-Y35879 represent the proteins encoded by all the open reading frames in the complete genome (see AAY91990) of Chlamydia pneumoniae. C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAY34584-Y35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae nucleotides sequences can also be used as immunogenic compositions.

                                                                                                                                                                                                                                                                                                             The specification describes the use of p53 transcription tags for developing products to determine p53 status, to diagnose cancer and to evaluate cytotoxicity or carcinogenicity of a test agent.

A method for diagnosing cancer or determining p53 status in a sample suspected for being neoplastic comprises comparing the level of transcription of an RNA transcription of the transcript in a second sample (s1) of a second tissue (s2), where s1 is suspected of being neoplastic and s2 is a normal human tissue (of the same type) and the transcript is identified by a tag; and categorizing s1 as neoplastic or as having a mutant p53 when transcription is found to be the same cor lower in the first, than in s2. The methods and products can be used to determine p53 status, to diagnose cancer and to evaluate cytotoxicity or carcinogenicity of a test agent. AAY23992-Y24000 represent human PIG

AAQ15504). The enzyme encoded by the sequence has a CBD which is homologous to a terminal A region of T.reesei cellulase and is able to bind to insoluble (hemi)cellulosic substrates. See AAQ14838-Q14842.

GENERAL INFORMATION:
APPLICANT: NICHOLS, Scott E.
TITLE OF INVENTION: Substitutes for modified Starches and
TITLE OF INVENTION: Latexes in Paper Manufacture
FILE REFERENCE: 0357CR
CURRENT APPLICATION NUMBER: US/09/210,361
CURRENT FILING DATE: 1998-12-11
EARLIER APPLICATION NUMBER: 09/007,999
EARLIER APPLICATION NUMBER: 09/07,999
EARLIER FILING DATE: 1998-01-16

aximum DB
     Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Score

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

FUNCTION: PRODUCTION OF EXTRACELLULAR GLUCANS, THAT ARE THOUGHT TO PLAY A KEY ROLE IN THE DEVELOPMENT OF THE DENTAL PLAQUE BECAU OF THEIR ABILITY TO ADHERE TO SMOOTH SURFACES AND MEDIATE THE AGGREGATION OF BACTERIAL CELLS AND FOOD DEBRIS.

CAPALYTIC ACTIVITY: SUCROSE + (1,6-ALPHA-D-GLUCOSYL)(N) =

D-FRUCTOSE + (1,6-ALPHA-D-GLUCOSYL)(N+1).

D-FRUCTONE + (1,6-ALPHA-D-GLUCOSYL)(N+1).
                                                                                                                                                                                                                                                                                                1,6-GLUCOSE).
SIMILARITY: TO OTHER GLUCOSYLTRANSFERASES
BINDING PROTEIN FROM S.MUTANS.
